Office of the Surgeon-General
with the Government of Madras,
Ootacamund, 25*th June* 1914.

No. 63/504.

From

The Hon. Surgn.-Genl. W. B. BANNERMAN, C.S.I., K.H.P., M.D., D.SC., I.M.S.,
Surgeon-General with the Government of Madras,

To

The CHIEF SECRETARY to GOVERNMENT,
Public Department.

Sir,

I have the honour to submit for the information of Government the following Report on the Civil Hospitals and Dispensaries in the Presidency for the triennium ending 1913.

I.—City of Madras.

2. The State-Public hospitals are the General, Ophthalmic, Leper, Maternity and Voluntary Venereal Hospitals. These were all at work throughout the triennium; as also were the Royapettah Hospital and three dispensaries supported by the Corporation. In addition to the four old-established aided institutions, viz., the Native Infirmary, Sir S. Ramaswami Mudaliyar's Lying-in-Hospital, the Victoria Caste and Gosha Hospital, and the San Thome dispensary, the following were open to the public also, namely, the Kalyani Hospital for women (added in 1913), the Venkataramana dispensary and the Sri Kanyaka Paramaswari Ayurvedic dispensary aided by the Corporation. The statistics of all the above institutions are included in the accompanying returns. The St. Thomas' Convent dispensary is also aided, but no proper statistics were available for 1913. Four dispensaries maintained by the Railways and the Port and Marine dispensary will be separately dealt with.

3. During the year 1911 thirty-four beds for each sex were added to the accommodation available in the Ophthalmic Hospital. In 1912 a reduction of 40 was ordered in the number at the Voluntary Venereal Hospital; additional provision for ten male and five female beds was made in the Royapettah Hospital; and the Sir Ramaswami Mudaliyar's Lying-in-Hospital increased its accommodation by two beds. The Kalyani Hospital, which now receives a grant from the Corporation, has been brought into the return for 1913, thus increasing the number of beds by twenty. The in-patient accommodation in the city hospitals now stands at 751 male and 781 female beds; there are also 27 beds, for either sex, in the contagious wards of the General Hospital. The isolation hospitals provide beds for plague cases when they are imported into Madras. The institutions I have mentioned, exclusive of the Railway and Marine dispensaries, treated in all 960,583 patients. This is an advance of 15 per cent. on the total of the previous triennium. The items of race, sex and age are interesting when compared with the census statistics.

4. According to the last Census Report the population of Madras comprises, in every hundred, Europeans and Anglo-Indians, 2·80; Hindus, 80·19; Mussalmans, 11·40; other classes, 5·61; adults—male 40·41 and female 37·48; children (up to ten years of age)—male 10·97 and female 11·14. The number treated, comprised, in every hundred, 42·57 male and 31·04 female adults, with 14·18 male and 12·21 female children. The races, in the order named above, contributed 8·84, 56·50, 13·80 and 20·86 per cent. respectively. Hindus formed 46 per cent. and Mussalmans 13 per cent. of those treated in the hospitals for women and children, the remaining 41 per cent. being Europeans, Anglo-Indians and classes other than Hindu and Mussalman. Of the women treated in the large maternity hospitals in the Presidency town 29 per cent. were Hindus, only 3 per cent.

Mussalmans and the remaining 68 per cent. Anglo-Indians and other classes. It is distinctly disappointing that the Hindu community do not use the hospitals as freely as other classes. The Hindu realises the advantages of serving in Government departments but has not realised to the full the benefits Government offer in the shape of medical relief especially provided for the female population.

5. In the Presidency town there were 74,713 in-patients. The daily average number was 1,219·55 in 1911 and has risen to 1,280·84 in 1913. The mean daily average for the triennium included 667 male and 512 female adults and 74 children; in other words, 11 per cent. of the male and 25 per cent. of the female beds were unoccupied. There were 7,390 normal and 4,655 abnormal labour cases admitted and delivered during the last three years, but this is a very small proportion to the 60,000 births during the triennium. The admission for diseases of the generative organs (in females 7,573 and without specification of sex 2,025) rank next in frequency. Disorders of the digestive system (8,244); eye affections (6,659); Malaria (3,698); and injuries (3,430).

6. In the previous triennium there had been 6,674 normal and 4,949 abnormal labours. Deducting the number treated in the Kalyani Hospital during the last year, the totals for the triennium under review were *7,293* normal and *4,637* abnormal labours. The number of births in the city exceeds 19,000 annually; so that less than one-fourth of that number takes place in the hospitals; and the annual increase in the fraction, slight as it is, occurs in the direction of normal labours among the classes other than the Hindu and Mussalman. It is satisfactory to notice that the poor of the European, Anglo-Indian and other classes appreciate the benefits of the maternity hospitals. It is hoped that the poor of the Hindu and Mussalman classes will in time come to appreciate the great advantages offered by the maternity hospitals of the Presidency town, and will overcome the prejudice of religion and custom in this matter.

7. In the class A institutions (open to both sexes) 67·45 per cent. of those treated were discharged cured or relieved, which is slightly better than in the last triennium. The mortality varied from 14·39 per cent. at the Native Infirmary to 4·86 at the Royapettah Hospital, the variation being due to the impoverished condition of those seeking relief at the former. The death-rate for the class was 6·88; 5·25 per cent. remained under treatment at the end of 1913, and the rest had been discharged "otherwise". In the class B hospitals (for women and children only) the percentage of recovery was 82·79; the highest and lowest rates of mortality were 2·35 and 0·85; 2·72 per cent. remained under treatment, and the rest had been discharged "otherwise." The difference in the results between class A and B hospitals merely marks the comparatively severer nature of the conditions to be dealt with in the class A hospitals.

8. No out-patients are treated at the Voluntary Venereal Hospital and the Native Infirmary. In the other institutions the out-patients numbered 885,870; after deducting 48,300 treated at the new dispensaries added in 1913 the balance gives the older institutions credit for an increase of 9 per cent. This is satisfactory. The total number of out-patients includes 376,383 men, 260,795 women and 248,692 children. The mean daily average attendance was 927 men, 578 women and 557 children. These figures suggest the necessity for opening a public hospital for children in the city, and it is certain it would meet a felt want. There is not the slightest doubt that children are better attended to by medical men who specialise in children's diseases, and this in its turn would serve to attract the Hindu and Mussalman females to secure for themselves the benefits of Western methods of treatment. The most common diseases among out-patients were—diseases of the digestive system (165,160), skin diseases (93,093), respiratory affections other than tubercular (85,014), malaria (75,706, of which 38,492 sought treatment in 1913), ear diseases (51,298) and diseases of the eye (44,442); and 55,108 sought treatment for injuries.

9. In 1911 there were 23,918 operations performed; for the next two years the totals were 24,988 and 27,072. This is a marked increase on the number (64,348) registered in the previous triennium. This is most satisfactory showing that operative surgery if well done is beginning to be appreciated. A great majority of the operations were done by Government officers. The nature of the

operations varies but little from year to year, so that an analysis of the last year's work will suffice to explain the others; for this purpose the totals for Madras and for the rest of the province are separately given under each group of operations in the statement G annexed. The most commonly occurring operations were operations for abscesses (6,757), dental operations (5,926), those on the eye and its appendages (3,053), and operations on the skin, including the opening of boils, etc. (2,603).

10. The majority of operations performed on in-patients require both operative skill and subsequent attention. Ten thousand one hundred and fifty-seven such operations occurred in 1913. The most frequent were extraction of the lens (749), operations to effect delivery (615), abdominal section (417), and operations for external hernia (222). The mortality was highest among operations on the thyroid body (33 per cent.); in other cases it varied from 10·83 per cent. among certain operations on the abdomen to 0·07 for operations on the eye; the death-rate after serious operations was only 0·74 per cent. which is exceedingly satisfactory. Over 94 per cent. of those operated on were discharged cured or relieved. This could hardly be better.

11. Considerable expenditure was incurred in extending and improving the City hospitals. For this purpose the State laid out Rs. 4,87,301 for the Maternity, Rs. 1,33,542 for the Ophthalmic, and Rs. 90,304 for the General Hospital; and the Corporation spent Rs. 1,15,301 on the Royapettah Hospital. Sundry additions were also made to the staff employed in the State hospitals. The total cost of the city hospitals and dispensaries was Rs. 29,25,980 as contrasted with Rs. 21,08,758 in the preceding triennium. The Government contributed 80·77 per cent. of the income; the Corporation, 10·88; interest on investments, and miscellaneous receipts, 5·23; subscriptions, 1·97; the Monegar Choultry and other private funds 1·10. The subscriptions amounted to Rs. 1,813 from Europeans and Rs. 56,773 from Indians; of these amounts Rs. 765 and Rs. 55,217 were subscribed for the Victoria Caste and Gosha Hospital, which was thus enabled to add Rs. 33,954 to its invested capital. Excluding the charges on "Buildings" and "Investments" the expenditure yields the following averages:—In the State hospitals, the daily cost of diet was As. 6–3; the expenditure per patient on other items was As. 11–7. In the other institutions, under the same headings the rates were As. 3–2 and As. 3–3, respectively. If the State hospitals only admitted the really poor the average per head would undoubtedly approximate more closely to the rates in the hospitals where only such seek relief.

12. The Port and Marine dispensary gave relief to 3,950 male out-patients for injuries, fevers, indigestion, etc. At the Railway dispensaries 422,227 out-patients of both sexes were treated; these included railway employees, their families and dependents; and the disease roll was much the same as in the public institutions.

II.—Mufassal Districts.

13. *State-Special institutions.*—At the end of 1910 there were at work 42 police hospitals, two dispensaries for canal establishments and seven for other State services, such as Forest, Revenue and Public Works Departments. In 1912 a police hospital was opened at Narasapatnam (Vizagapatam) and in 1913 one was opened at Kalichedu (Nellore). The Forest College dispensary (Coimbatore) began work in 1912; and a dispensary for the Mopad Reservoir project was started in 1913. The Police hospitals have accommodation for 526 males; and eight beds for females were set aside for the families of Police subordinates at Kalichedu. The total treated in these State-Special institutions was 29,364 in and 121,623 out-patients. Malaria, rheumatic fever, dysentery, respiratory diseases and disorders of digestion were the most frequent causes of admission.

14. *Railway dispensaries.*—There were two hospitals and 38 dispensaries maintained by the Railways. Four dispensaries were opened in connection with new construction work at Paravatipur, Bobbili, Madanapalle and Palakodu; and two of these (Madanapalle and Palakodu) are still working. The hospitals treated 516 in-patients, the out-patients in all numbered 422,227. The diseases most in evidence were those named in the last paragraph.

15. *Private non-aided institutions.*—The number of these is steadily increasing. Twenty-four were added to the list during the triennium; three were transferred to the class of aided institutions; two were closed in 1912, and have not yet been re-opened; there remained 39 open to both sexes and 15 for women and children only. The accommodation for in-patients on the 31st December 1913 was given as 294 beds for males and 559 for females. The dispensaries at Berhampur and Salur supplied no detailed statistics (which is not satisfactory), but gave totals of 51,543 and 29,000, respectively. In the remaining institutions 28,244 in-patients and 893,182 out-patients were treated; 61 per cent. of the in-patients and 50 per cent. of the out-patients were females, but the omission of the age limit prevents any comparison with the statistics of the public hospitals. Among general diseases malaria and rheumatic fever figured prominently; diseases of the digestive system, ulcers and skin diseases and respiratory affections were the commonest types of local diseases; 2,239 normal and 1,364 abnormal labours were conducted; and 41,704 operations are reported. The deaths numbered 2,792; this yields a ratio of 9·8 per cent. on in-patients, but the registration may include some deaths among out-patients also. This death-rate in Private non-aided institutions is higher than the death-rate in the public institutions. More accurate returns might perhaps affect these figures. I am of opinion that a large number of these institutions should be aided so as to secure details of work actually done—diseases treated and operations performed—and to enable the State to inspect where necessary. The sudden closing of private dispensaries which work for only a short period of the year might be avoided; and there is no doubt that the advice and inspection of the District Medical Officer will be appreciated in most cases.

16. *State-public, Local Fund and Private-aided institutions.*—The institutions maintained or aided from public funds and open to the public at the end of 1910, included 9 State-public, 463 Municipal and Local Fund and 21 private-aided hospitals and dispensaries. In 1912 a State-public dispensary was opened for a season at Ervade (Tinnevelly) for treatment of malaria; it was again opened in April 1913, and has been sanctioned for one year. During the triennium nineteen new Local Fund Dispensaries were opened; one dispensary in the Salem district was closed in 1911 and re-opened in 1912; the Conjeeveram Women and Children's Hospital (Chingleput) was closed from May to December 1912 for want of a female medical practitioner, and was re-opened the following year. The Municipality should have made greater effort to obtain a substitute; a rich Municipality like this can afford to give a really good lady doctor sufficient pay and prospects to remain on. In 1913 one dispensary in Bellary district and two in Tanjore district were closed. Three previously non-aided institutions were put on the aided list in 1911 as already mentioned; and the Tuberculosis Sanatorium, Madanapalle, was similarly dealt with.

17. At the end of 1910 there were 2,227 beds for males and 1,623 beds for females available; at the end of the last triennium the numbers had increased to 2,492 and 1,750, respectively. In hospitals for women and children 178 beds for females existed. Twenty beds for each sex is the accommodation of the Sanatorium for Tuberculosis at Madanapalle. In the Leper Asylums at Saluru, Bapatla, Palliport, Calicut and Mangalore 318 and 164 beds are reserved for males and females, respectively.

18. The total number treated was 17,709,240, an increase of 9 per cent. on the total of the preceding triennium; the institutions for women and children contributed 3·85 per cent. of the total; 178,707 were in-patients. The adult male population furnished 65·8 per cent. of in-patients and 51·3 of out-patients. 74·36 per cent. of the total treated were Hindus, and 12·92 were Mussalmans; 71·36 per cent. of the adult females were Hindus, and 12·60 were Mussalmans; and of the women who sought treatment in the hospitals for women and children the Hindus formed 67·06 per cent. and the Mussalmans 16·11 per cent.

19. Hindus in general, and Hindu females in particular, attend the public hospitals fairly freely in the north of the province; *e.g.*, in the Vizagapatam district the Hindus form 91·48 per cent. of the adult female population, and contributed 89·87 per cent. of the females who sought treatment. In the south and in the west the Hindu women do not come forward so freely for treatment

in hospitals; *e.g.*, in Tanjore the Hindus form 90·33 of the adult female population, but only 80·59 per cent. of the females who attended hospitals are Hindus; in Malabar 68·18 per cent. of the adult female population are Hindus, but only 53·09 of the adult females attending hospitals are Hindus. This is accounted for by the trammels of caste being stricter in these districts.

20. In 1911 the daily average number of in-patients included 1,624 men, 742 women and 140 children. In 1913 the average numbers were 13 men and 12 women at the Tuberculosis Sanatorium; 191 men, 81 women and 12 children at the Leper Asylums; 97 women and 8 children at the class B Hospitals; 1,613 men, 605 women and 143 children at the remaining institutions. Generally the beds available in the district head-quarter hospitals were occupied by patients throughout the year; but in some places the provision for in-patients is not fully taken advantage of. For example, in Chingleput the number of unoccupied beds averaged 12 for males and 13 for females; in Conjeeveram, 14 for males and 13 for females; in Tanjore, 24 for males and 44 for females; on the whole 27 per cent. of the beds for males and 48 per cent. of those for females were unoccupied. These figures are somewhat startling; and I am inclined to think that what is required to encourage the hospitals to be used to the fullest extent is to provide proper trained nurses and caste attendants to attend the sick, instead of the inferior class of ill-paid ward servants that the local bodies now usually employ.

21. The most common causes for admission were diseases of the digestive system (20,537), injuries (18,856), malaria (16,962), ulcers and other diseases of the skin (14,179), generative diseases (9,978), syphilis (8,686), labour (7,768), rheumatic affections (6,556) and dysentery (5,810). Over 82 per cent. of the total treated were discharged cured and relieved; 9·73 per cent. were discharged "otherwise" and 2·96 per cent. remained under treatment at the end of 1913. The death-rate was 5·05 per cent. on the total; this compares most favourably with the private institutions in paragraph 15, which had a death-rate of 9·8 per cent.; among infective diseases the percentage was 7·54; it was 7·18 for diarrhœa and other disorders of digestion, and 4·62 for injuries.

22. The number who sought relief as out-patients comprised 8,993,748 men 3,836,274 women and 4,700,511 children; this is an increase of 11 per cent. on the total of the previous triennium. In 1911 the daily average attendance included 17,356 men, 8,310 women and 8,569 children; in 1913 the average was 18,455 men, 8,719 women and 9,444 children; the increase among women is very much less than that among men and children.

23. Ulcers and skin diseases (21·5 per cent.) and diseases of the digestive system (17·4 per cent.) were the commonest ailments under treatment. Next in order but with less than half the frequency came eye diseases, malarial affections, diseases of the ear, respiratory diseases and rheumatism acute or chronic. Nearly 6 per cent. sought treatment for injuries; 91,014 (0·52 per cent.) women in labour were attended at their homes by the medical staff and midwives, and were registered as out-patients "represented by friends."

24. The Municipal budgets provide for 79 midwives; the District Boards have appointments for 296; and, adding those employed in the private-aided institutions, the number of midwives working under supervision may be set down as 385. As I remarked in my report last year the work done by the midwives is not satisfactory. In some districts—*e.g.*, Anantapur and Tanjore—the number of cases recorded is steadily increasing; in others—*e.g.*, Chingleput and South Arcot—the fall in the number is as strongly marked. By a Circular (No. 44) issued in 1910 Surgeon-General Benson ordered that the entry under *Labours* in Statement C (i) "should include cases attended by medical officers, subordinates and midwives in hospital as well as outside." The in-door and out-door cases already mentioned therefore comprise all the cases attended by the midwives, and some cases which were conducted by the medical subordinates in places where no midwife has yet been appointed. The bad record in this branch of medical relief can only be explained as follows:—The local bodies offer much too small a salary (Rs. 8) to secure a proper midwife; they do not adopt an uniform standard of qualification; they take no precautions to secure reserve hands; so that when vacancies occur in listed ppointments, from absence on leave or sickness, no attempt is made to

replace the absentee; and any suggestion that a District Medical Officer may make to extend this method of relief is vetoed for want of funds. With the comparatively scanty outturn of normal obstetric work in the district centres—none of them attains to an average of one case a day—the head-quarter hospitals cannot prove satisfactory schools of training for midwives; and the employment of such locally-trained midwives (which is the system most in vogue among Local Boards) cannot be considered as tending to popularise good midwifery. Midwives who receive local training very soon revert to barber-midwife methods; so that I am in favour of all midwives being trained at properly equipped schools such as exist at Madras and Tanjore. I sent a Circular to all Collectors, Presidents of Taluk Boards and Chairmen of Municipal Councils, last December with regard to the better training of midwives, but they have not as yet supported me in the way I expected them to do. The facilities for the thorough teaching of midwives now available at the Giffard School in Madras, to which attention was drawn in the above Circular, have not yet been properly taken advantage of. The indifference displayed about the filling up of vacancies also helps in depreciating the economic value of this class of servant; it is open to the Local Board Members to argue that if a place can get along without a midwife for two months there is no reason to spend even Rs. 8 a month for the rest of the year.

25. The average mufassal Indian does not seek operative aid unless driven to it by pain. He will come readily to have a tooth drawn, but will tolerate a hydrocele until it grows to an enormous size; he will consent to have a boil opened, but postpone indefinitely a suggestion to have a tumour removed. In spite of this national characteristic, and also of the comparatively poor equipment at their disposal, the medical staff in the mufassal institutions have done really good surgical work. The number of operations increased from 201,417 in 1911 to 226,412 in 1913. The patients operated on were less than 4 per cent. of the total treated, whereas in Madras City nearly 8 per cent. underwent operations. The operations performed in 1913 are detailed under the various groups in the statement G attached; it will be seen that excepting operations on the brain and on the spinal column every variety performed in the City has been with nearly as good results performed in the mufassal. Dental operations (65,132), those for the treatment of abscesses (63,732) and sundry operations for boils, ulcers and other conditions of the skin (30,922) were most frequently performed. Nearly 7 per cent. of the operations were performed on in-patients; among these were extraction of the lens (906), operations to effect delivery (1,695), abdominal section (173) and operations for external hernia (549)—a record which can well bear comparison with that of the City hospitals in paragraph 10 *supra*. The mortality after obstetric operations was 6·5 per cent. This is high, but is due to many cases being brought too late to hospital. If a good class of midwife were available in the district, cases requiring operative interference would be brought sooner to the hospital, and the mortality would be much less. Nearly 5 per cent. of abdominal operation cases died; but this is clearly due to the want of better hospitals, a proper nursing staff at head-quarter hospitals and better equipment. The death-rate was comparatively low in other operations, and on the total was only 0·19 per cent.

26. Setting aside the sums invested during the triennium the expenditure in the mufassal State, Local Board and Aided institutions amounted to Rs. 50,37,238. Government contributed 4·29 per cent. as salary and 6·31 per cent. in grants for building and other purposes. Local Fund Boards and Municipalities contributed 60·69 and 22·61 per cent. respectively; and 3·30 per cent. was realised by subscriptions. Rupees 6,65,216 were expended on additions and repairs to buildings. Over 51 per cent. of the expenditure was incurred for the establishments, and nearly 19 per cent. was expended for medicines. Exclusive of the charge for building the expenditure works out at the daily average rate of As. 2–5 per patient for diet and As. 1–8 for all other items.

27. I would desire special attention to the necessity for—

(1) State aid to private institutions, and as a consequence inspection by the Local District Medical and Sanitary Officer. The death-rate in these institutions is high at present.

(2) An efficient nursing staff and caste attendants, by which the Hindu population may be induced to use more freely the State hospitals.

(3) A proper class of midwife trained in a school for midwifery and employed by Municipalities and Local Boards in sufficient numbers, a reserve being maintained.

(4) A Provincial Nursing Staff to nurse serious cases. At present there is practically no trained staff to look after serious operations and medical cases.

III.—MISCELLANEOUS.

28. Excluding labour cases, there were 1,187,095 attendances for infectious diseases, 628,703 for general diseases, 3,700,811 for systemic diseases, 417,693 for injuries and 12,662 for poisons, giving a percentage of 16·75, 8·87, 52·23, 5·89 and 0·18, respectively, the proportion being almost the same as for the last triennium except for a slight fall under general diseases.

29. *Infectious diseases*—(1) *Cholera.*—Twenty-five thousand one hundred and twenty cases were treated, showing an increase of 3,273 on the number given for 1908, 1909 and 1910. Of these cases 48 per cent. were treated during the year 1912. The mortality was 4 per cent. This is the same as the last triennium.

(2) *Dysentery.*—The number of cases treated was 346,049. They formed on an average 1·65 per cent. of the total treated, showing a decrease of 0·01 per cent. on the last triennial report. The death percentage was 0·4 on the total number of cases.

(3) *Small-pox.*—Amongst the 1,066 cases treated during the triennium, 595 had been vaccinated, 54 re-vaccinated and 49 had previous attacks, and 368 were unprotected. The average stay in the hospital for the first three classes was 17, 12 and 11 days, respectively, and for the last unknown. Mortality for the first three classes was 1·98 per cent. under vaccination, 1·85 per cent. under re-vaccination and 0·64 for previous attacks. Of the 368 patients who were unprotected 160 died, which is equal to a mortality of 43·48 per cent.

(4) *Septicæmia.*—Out of the cases admitted into the hospitals of classes I, III and IV (Statement A) for septicæmia there were 393 deaths from septic disease acquired before admission and 19 from sepsis acquired in the hospitals after operation.

(5) *Kala Azar.*—One thousand and sixteen cases were treated in the whole Province, the majority being in Madras itself. Of the in-patients 15·17 per cent. died, a decrease of 3 per cent. compared with the last triennium.

(6) *Leprosy.*—A considerable increase is seen under this heading and is proportional to the increased accommodation in the Leper Asylums. The numbers treated during 1911, 1912 and 1913 were 1,197, 1,669 and 1,716, respectively.

(7) *Malaria*—shows a slight decrease in the total treated, 0·18 per cent. less than the average percentage for the last triennium.

(8) *Plague.*—One thousand six-hundred and thirty-eight cases were treated. There was a considerable increase in the number treated in 1912 followed by a fall in 1913. The death-rate was 3·26 per cent. on the average.

(9) *Pneumonia.*—Four thousand four hundred and eighty-eight cases were treated in 1911, 4,867 in 1912 and 5,457 in 1913, giving a total of 14,812, of which 4,783 were treated as in-patients and 10,029 as out-patients. Of the former 724 proved fatal, giving on an average a death-rate of 5·03 per cent.

(10) *Rheumatic fever and rheumatism*—stand second in order under infective diseases and were mostly treated as out-patients.

(11) *Tuberculosis* was the cause of admission in 14,144 cases in 1911, 15,013 in 1912 and 15,888 in 1913, with 867 deaths in the triennium. Most of the cases occurred in Madras, Malabar and South Canara. Special measures to combat this disease are being taken and a sanatorium has been opened at Madanapalli. The King Edward VII Memorial Fund in Madras is to be devoted to the establishment of a Tuberculosis Institute in the Presidency town to be worked on the well known "Edinburgh system."

30. *General diseases.*—Anæmias form 0·96 per cent. of the total treated, and were mostly treated as out-patients.

31. *Systemic diseases.*—(1) Diseases of the digestive system form 17·55 per cent. of the total.

(2) *Diseases of the eye.*—These show a steady increase and form 7·23 per cent. of the total, and are equally well marked in all the institutions.

(3) Ulcers and other diseases of the skin form 19·27 per cent. of the total number, and stand third in order amongst systemic diseases.

32. *Injuries* form 5·57 per cent. of the total. There were 7,201 in-patients with 321 deaths giving a mortality of 4·46 per cent.

33. *Poisons.*—There were 616 cases of opium poisoning reported during the whole triennium, 48 per cent. of the cases having occurred in 1912. Only 16 of these were treated as in-patients and 4 had a fatal termination.

34. *Sub-Assistant Surgeons.*—At the end of the year 1913 there were 43 Sub-Assistant Surgeons of third grade and 31 of fourth grade in independent charges. Of the 43 third-grade men 7 were Local Fund, 1 retired and the remaining 35 Civil Sub-Assistant Surgeons. These were given independent charge only where subordinates of Senior grades were not available.

35. *Lending Libraries.*—The Lending Libraries established under G.O. No. 436 L., dated 20th March 1908, show considerable progress. The income realised during the year 1913 was Rs. 12,113-1-5. The number of books was increased by 439 at an outlay of Rs. 5,203–9–5. There were 510 members at the end of the year, the subscriptions amounting to Rs. 1,239-4-0. The closing balance at the end of the year was Rs. 6,806–2–1 with 2,977 volumes in the Libraries.

36. *Inspections.*—The city institutions and the district head-quarters as well as the stations under the charge of Civil Surgeons have been regularly inspected by the Surgeon-General. Inspections of outlying stations have been made by the District Medical and Sanitary officers. Stock books and Service Registers were duly verified at such inspections.

I have the honour to be,

Sir,

Your most obedient servant,

W. B. BANNERMAN,

C.S.I., K.H.P., M.D., D.SC., I.M.S.,

Surgeon-General with the Government of Madras.

ANNUAL RETURNS.

STATEMENTS A—J.

Classes I and II.—These include all institutions maintained by Provincial funds and under Government management. The fact that an institution possesses endowments or receives contributions from Local Funds or private subscriptions should not be regarded as a reason for not classing it as 'State' so long as Provincial and Imperial funds are practically responsible for all the charges connected with it. Class I.—'Public' are State dispensaries which are open to the poorer classes of the public. Class II are State dispensaries which serve only a special section of the public as indicated in the sub-classification attached.

Class III.—Local Fund dispensaries include all institutions which are vested in Local Boards or Municipalities or guaranteed or maintained by Local or Municipal funds. The fact that such an institution is aided by private subscriptions, or receives assistance from Government in the shape of part of the salary of the medical officer, grants of medicine, or otherwise, should not be regarded as a reason for not classing it as a Local Fund dispensary so long as its existence is practically dependent upon Local Funds.

Class IV.—Comprises institutions supported by private subscriptions or guarantee, but receiving aid from Government or Local Funds.

Class V.—Comprises institutions maintained entirely at the cost of private individuals or associations. The fact that Government supplies superior inspection or registers should not be regarded as a reason for not treating it as a private non-aided dispensary.

Class VI.—Comprises all railway dispensaries whether maintained by State railways or others.

Class A = General institutions. Class B. = Women and Children institutions.

* The institutions as Berhampore was shown last year as class B instead of class A.

G.O. No. 1194, 18th September 1914.

Report on the working of the Civil Medical Institutions in the Madras Presidency.

Reviewing the — for the triennium ending 31st December 1913.

GOVERNMENT OF MADRAS.

PUBLIC DEPARTMENT.

Read—the following paper :—

Letter—from the Hon'ble Surgeon-General W. B. Bannerman, M.D., C.S.I., D.Sc., I.M.S., Surgeon-General with the Government of Madras.

To—the Chief Secretary to Government.

Dated—Madras, the 25th June 1914.

No.—63/504.

Abstract.—Submitting the report on the working of the Civil Medical Institutions in the Madras Presidency for the triennium ending 31st December 1913.

Order—No. 1194, Public, dated 18th September 1914.

Recorded.

2. The total number of institutions of all classes in the Presidency rose during the triennium from 637 to 684. This was largely due to the private institutions opened, chiefly by missionary bodies. An increase of 309 beds for males and 148 beds for females took place, but it is noticeable that the beds in hospitals are seldom fully occupied, an average of about one-fifth of those for males and nearly one-half of those for females being always empty.

3. The number of patients of all classes treated in all institutions was larger by some 650,000 *per annum* than in the previous triennium. There was also a steady and progressive decline in the death-rate of in-patients. The Government are anxious that medical relief should be brought within the immediate reach of the people everywhere and are therefore glad to note that private practitioners are increasing in numbers. It is possible that the above object might also be furthered by a system of itinerating dispensaries providing not only medical treatment but also facilities for performing the minor operations which figure so prominently in the returns. Such a system, it is understood, has been successfully introduced in the United Provinces and the Punjab. The Surgeon-General will be requested to obtain full information from these Provinces as to the methods, results and working of such institutions and submit a report to the Government on the above question.

4. Eleven new institutions for women and children were opened in the triennium under review. In this class of hospitals, again, the accommodation for in-patients was rarely fully utilised. The steady, if slow, increase in the number of caste wards may do something to remedy this. The new institutions were mainly provided by the Missions, that is, from funds collected in other countries. If private charity and benefactions in India more often took the form, so usual in the West, of endowing or aiding hospitals, the financial difficulty, which is at present the chief obstacle to the wider extension of medical aid, would be far less formidable. Indian subscriptions at present amount to less than one hundredth of the total cost of the hospitals. Twenty-eight per cent. of this total cost is debitable to medicines and diets, which are usually given free of any charge, whatever may be the means of the patient.

In other countries, those who can afford to do so are expected to contribute towards such expenditure and it is now under consideration whether in institutions maintained by Government and local bodies a portion of it may not be recovered by the levy of small fees from all but the poor.
